## 1.0 EXPORTER INFORMATION

TAMCO is a steel mini-mill that recycles ferrous scrap metal into concrete reinforcing bars (rebar). Mini-mills use electric arc furnace technology to melt scrap steel into semi-finished steel billets. These billets are then reheated and processed in a rolling mill where they are made into a wide variety of rebar lengths, sizes and grades.

TAMCO recycles over 500,000 tons of steel a year. This steel comes from junked cars, appliances, tin cans, used oil filters and industrial scrap. More steel is recycled in the United States than glass, aluminum, paper and plastic combined. Several years ago, TAMCO began accepting used oil filters (drained and crushed) for recycling into rebar. For every ton of used oil filters the company recycles, ten cubic yards of landfill are conserved and thirty-one gallons of motor oil is kept from landfills and oceans.

TAMCO captures dust emissions from the melting process with an efficient baghouse, thus keeping the dust from entering the atmosphere. Once the dust is captured, the iron, zinc, lead and cadmium in the dust is recycled, which reduces the amount of material that goes to hazardous waste landfills.

## **5.0 WASTE REDUCTION EFFORTS**

### **5.1 Efforts Undertaken to Reduce the Volume and Toxicity of Waste**

#### *5.1.1 Reduction in Volume*

Manufacturing steel from recycled steel represents a significant reduction in waste. Annual steel recovery efficiency average is 98.5%. Waste shipments are for additional recycling by metal recovery which continues to represent additional waste volume reductions.

#### *5.1.2 Reduction in Toxicity*

Inspections of incoming recycled steel continue at the facility preventing the introduction of unwanted materials. No changes can be expected in the Toxicity Characteristics of the baghouse dust.

**5.2 Description of Changes in the Volume and Toxicity of Waste Actually Achieved During the Year in Comparison to the Extent Such Information is Available for Years Prior to 1984.**

Data is not available in years prior to 1984. Current recovery efficiency is stable at an average of 98.5% for the last eight years.
